

EDUCATION

Columbus, GA	Columbus State University	Expected Graduation: December 2026
- Bachelor of Science in Computer Science - Software Systems Relevant Coursework: Computer Organization; Discrete Mathematics; Computer Networks; Security Information; Algorithms; Software Engineering; Object-Oriented Design; Programming Languages; Honors: President's List, Spring 2025		

TECHNICAL SKILLS

- **Languages:** C#, Kotlin, VB.NET, Java, Python, C++, Ruby, Prolog
- **Web/Data:** HTML, CSS, JSON, SQLite
- **Tools & Technologies:** Git, GitHub, Visual Studio, Linux, Windows, Firebase, PyTorch, ANTLR, .NET
- **Concepts:** Object-Oriented Programming, API Integration, Data Processing, and NLP

Work Experience

Software Developer (Consulting)	Jan 2026 – July 2026
- Worked alongside a software developer on paid client projects, including a LinkedIn automation and data extraction tool. - Contributed application logic for automating LinkedIn workflows and organizing profile and connection data. - Debugged issues, refined features, and improved reliability based on client requirements. - Improved data-processing workflows by refining filtering logic and handling incomplete or inconsistent API responses. - Worked with C# application code, API responses, and structured data while troubleshooting issues and implementing client-requested changes.	

PROJECTS

Transcriptive AI | Kotlin, Firebase, Python, PyTorch, NLP, VB.NET | 2025 - 2026:

- Built a Kotlin Android application for AI-assisted medical transcription with user registration, authentication, and hospital staff management.
- Developed the original desktop UI in VB.NET for medical transcription workflows, including transcription input, structured note generation, history, and settings features.
- Integrated Firebase for backend services and persistent user/staff data management.
- Contributed to a Python/PyTorch NLP system for medical specialty classification, entity extraction, and transcription error detection using the MTSamples dataset.
- Worked in an Agile team environment, contributing to iterative development, feature planning, testing, and project reviews throughout the development cycle.

LinkedIn Contact Search Tool | C#, .NET, Unipile API, JSON, CSV | 2025 - 2026:

- Built a C#/.NET application that searches LinkedIn companies and employees through the Unipile API using separate company and role keywords.
- Implemented cursor-based pagination, profile filtering, and API requests to retrieve email, phone, current company, and job-title data.
- Parsed JSON responses into C# models and exported qualified contact results to CSV, with cancellation and search-stop logic for long-running queries.

SimpleEnglish | ANTLR, Language Design | 2025:

- Designed a custom context-free grammar in ANTLR for an English-like programming language with variables, typed expressions, control flow, functions, and input/output constructs.
- Defined lexical and parsing rules for arithmetic, comparison, and logical expressions while handling operator precedence, nested statements, and block structure.

Object-Oriented Game | C# | 2024:

- Developed a modular C# game architecture using object-oriented design principles including encapsulation, inheritance, polymorphism, and abstraction.
- Applied Factory, Singleton, Observer, and Strategy design patterns to separate gameplay systems and support reusable, extensible components.
